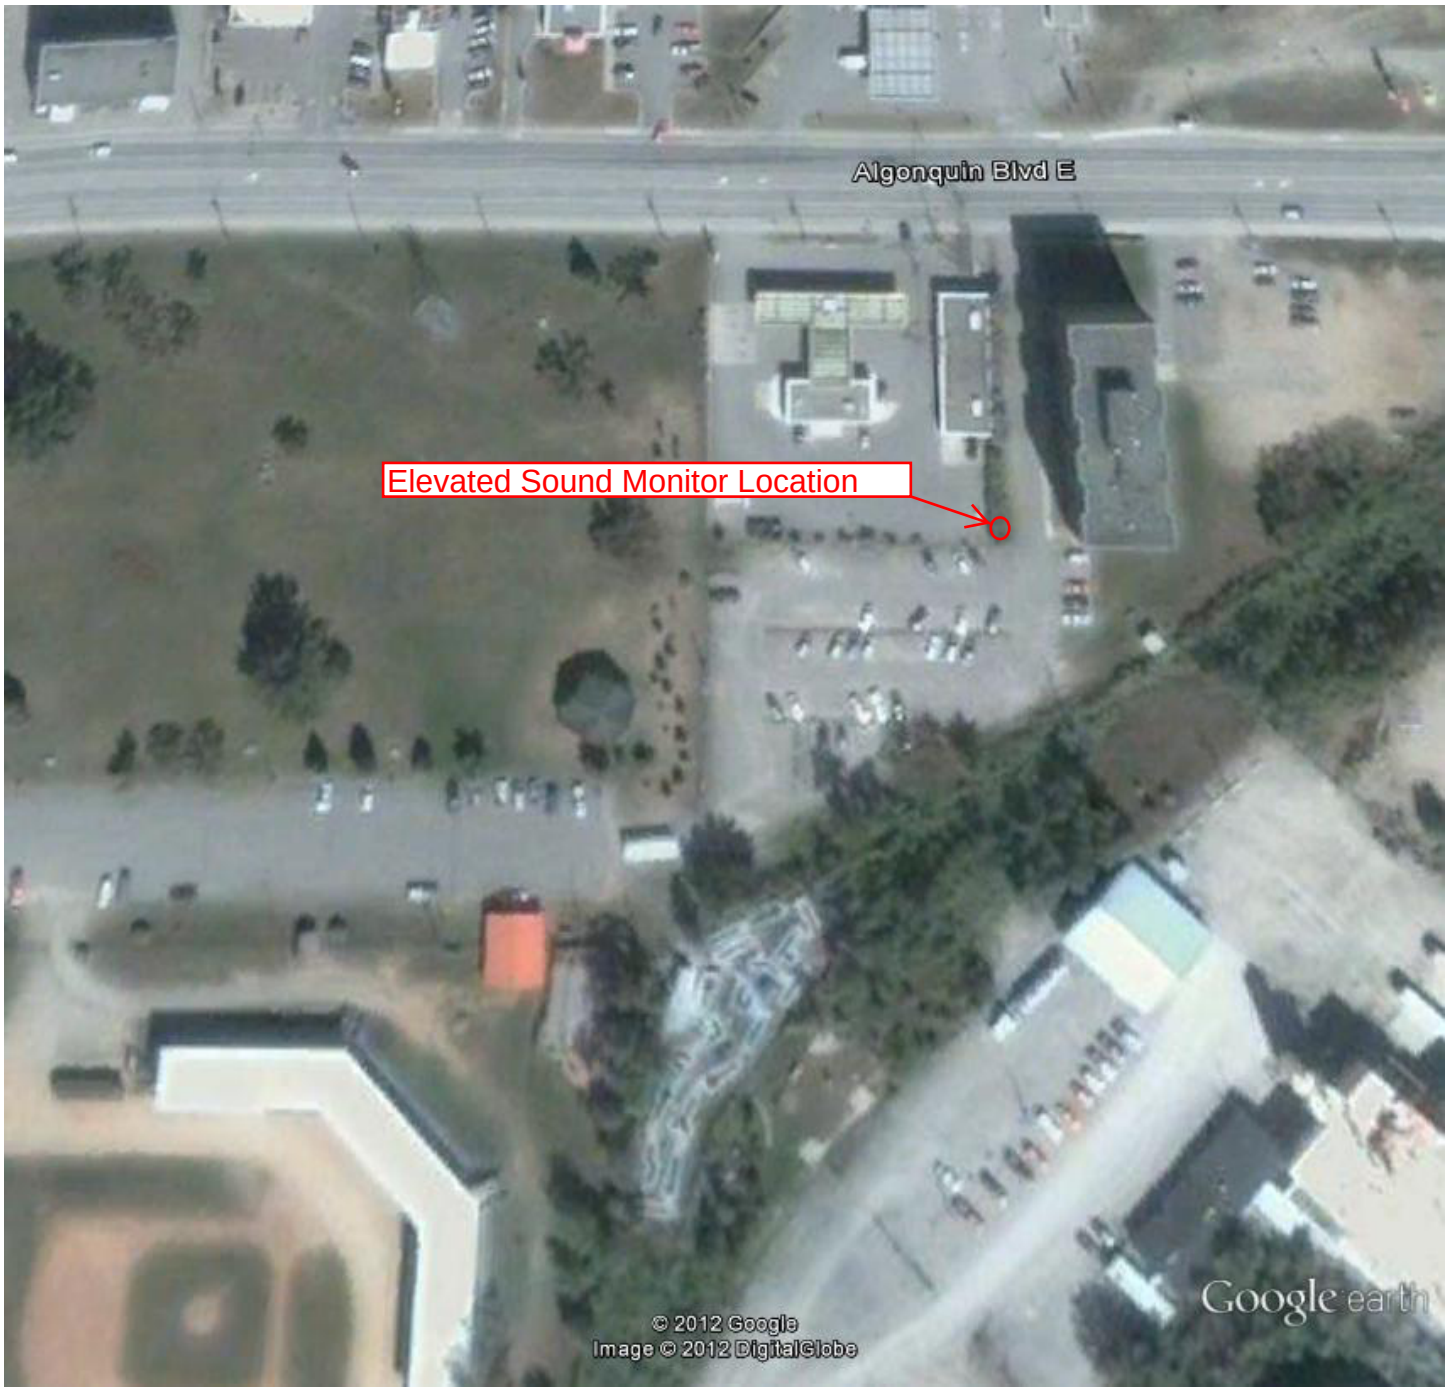
VIA FAX

Dear Mr. Hughes:

RE: Noise monitoring at Senator Place Apartments

Goldcorp – Porcupine Gold Mines formally requests your permission to install 1 or 2 noise monitoring devices on your building. The intent is to measure noise levels for approximately 1 week and would involve a short period of time to set up and then take down the equipment. During the monitoring, the equipment runs on its own and would not cause any further inconvenience. Preferably, the units should be on an outside wall or balcony of one of the top two floors, facing the operation area. We want to make note that all the information retrieved will be made available to you. I also propose a meeting at your convenience to discuss the request and suggestions you may have on how we could proceed.



I am extending our offer of presenting more detailed project information to you and/or small group that would explain the studies being done, controls included in our plans as well as an overview of the project. You can contact me on my cell at 705-365-8986 with any questions.

Sincerely,

Darren Fasciano
Project General Foreman

Re: SAE J88 Noise Testing

The attached report contains the results of equipment noise testing conducted on March 19, 2013 for machinery to be used in the Hollinger Pit gold mine. Testing was conducted in accordance with SAE J88 requirements, for determining the sound levels of Off Road Work Machines. Please do not hesitate to contact our office if you require clarification or any further information with respect to any material within this report.

Best regards,

Robert Plumridge, BASc., EIT

Introduction

Porcupine Gold Mines (PGM), a joint venture between Goldcorp Canada Ltd. And Goldcorp Inc. is in the final stages of pre-development of the Hollinger gold mine in Timmins Ontario to an open pit mine. As part of the process of determining expected noise impacts at nearby residential receptors, sound level ratings of equipment that will be used in operation is required. Akoustik Engineering Limited was retained by PGM to perform sound testing to SAE standard J88, "Sound Measurement – Off Road Work Machines – Exterior" to quantify actual sound levels of their equipment.

Test Parameters

Testing was conducted on March 19, 2013. Available equipment was tested at the Dome facility of PGM, in a large flat area which meets all requirements of J88 with the exception of using a paved area as outlined in Figure 1 of the standard, and included as Reference 1. During testing, a light coat of snow was covered on the hard gravel surface. Accounting for the snow cover is detailed further in the report. Due to production and scheduling conflicts, two pieces of equipment were tested in separate areas of the PGM properties. The equipment tested and the location of the test is included below in table 1.

Table 1: Equipment list and test location

Equipment	Test Location
D10	Dome
D9	Dome
Haul Truck	Dome
992G	Dome
Grader	Dome
Cubex	Dome
Hitachi	Dome
Excavator	Hollinger*
Smartrock	Hollinger*

(*) Denotes test areas deviated some from requirements of J88,ie. sites had light snow cover and slight inclines within the minimum radius detailed in Figure 1 of the Standard.

During testing, environmental conditions were monitored at all times to ensure humidity and wind speeds were within the requirements of J88. For mobile machines, testing was done in both the mobile and stationary positions.

Test Results

Testing was performed using a Bruel & Kjaer (B&K) 2270 sound level meter. For these measurements, 1/3 octave LZSmax (Level, un-weighted, slow response, maximum) values were recorded. For simplicity, only post A-Weighted frequency levels as well as the overall (broadband) LASmax values will be

reported. During testing, all equipment maintained a variance between tests under 2dB, so only the minimum numbers of measurements were performed on each vehicle. Results are shown below in Table 2 of the averaged moving and stationary tests of each vehicle.

Table 2: 1/3 Octave Equipment Sound Levels

	992		Haul Truck		D10		D9		Grader

Equipment Power Levels

All results listed in Table 2 are Sound Pressure Levels at 15m distances. In order to compare the expected impact at other locations, it is important to determine the Sound Power Levels of the equipment. To calculate the sound power level, the following equation was applied:

$$Lw = Lp + 20\log(r) + 11 \pm ground\ /\ atmospheri\ c\ _\ correction\ s$$

For measurements conducted at the Dome facility, a conservative ground reflection/absorption correction of -2dB is applied to account for the light snow cover. For measurements at the Hollinger location, a more conservative correction of -1.5dB is used, to account for the additional snow cover, and slightly sloping terrain. Calculated Sound Power Levels are included below as table 3.

Table 3: Equipment Sound Power Levels

	992		Haul Truck		D10		D9		Grader					
Frequency Band	Moving	Stationary	Moving	Stationary	Moving	Stationary	Moving	Stationary	Moving	Stationary	Cubex	Smartrock	Hitachi	Excavator
LASmax (overall)	75.06	74.87	85.55	85.25	85.02	75.71	83.70	79.39	70.56	69.88	79.72	73.37	82.37	71.98
LW (A)	**107.6**	**107.4**	**118.1**	**117.8**	**117.5**	**108.2**	**116.2**	**111.9**	**103.1**	**102.4**	**112.2**	**106.4**	**114.9**	**105.0**

Conclusion

Every effort was made during the measurement process and reporting process to meet the guidelines of SAE J88. Further, the levels observed are in close comparison with past field measurements taken by Akoustik Engineering Limited of similar equipment under real operating conditions. As such, use of these values for predicting expected sound levels through application of modelling techniques at residential receptors is applicable.

For akoustik engineering limited
