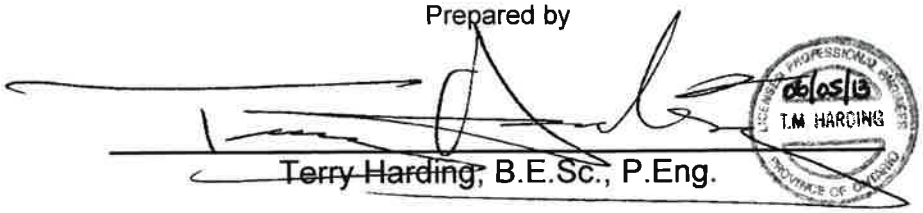
Acoustic Assessment Report

Goldcorp Canada Ltd.

Hollinger Project

Operations Noise

Environmental Compliance Approval Application



Open Pit Mine (Reactivation)
Timmins, Ontario

1.0 INTRODUCTION AND EXECUTIVE SUMMARY

This Acoustic Assessment Report (AAR) has been prepared in support of an application to the Ministry of the Environment (MOE) for an Environmental Compliance Approval Application – Air (ECA) under the Environmental Protection Act (EPA) for the reactivation of the open pit mine known as the Hollinger Mine, in the City of Timmins, Ontario.

The potential for environmental noise emissions during the regular operations and associated with the extraction of and transportation of the ore bearing material to the off-site, processing facility, as well as removal and storage of the mine rock, has been reviewed.

This report has been updated to address the following primary items:

1. Comments received from the Ministry of the Environment as summarized in their letter of February 2, 2012,(referred to subsequently as to the February 2012 letter).

2. Revisions to the mining plan including total equipment numbers that have increased slightly from the previous acoustic assessments reviewed and submitted.

3. Changes in regard to how the perimeter environmental control berm (the "ECB") will be constructed: now proposed to be completed in its entirety prior to the initiation of full mining operations, rather than constructed in sections concurrent with full mining operations as presented in previous submissions.

4. Updated sound emission levels for a majority of the primary equipment sources based on sound measurements of the actual equipment to be used at the Hollinger Project and following methods consistent with MOE requirements. This includes dedicated pit equipment as well as the haul trucks.

5. A revised operations scenario for the full life of the pit, and using the same comprehensive operations scenarios as presented in the revised Air Quality Assessment report recently submitted to the MOE.

6. All waste rock will be transported to the Dome site, rather than stored within the fence line. The exception will occur as pits are backfilled when phases of pit excavation are completed. With all waste rock going to the Dome site, a greater number of truck movements on the transportation corridor will occur, and has been accounted for in this update.

7. Acoustic modelling using the actual proposed bench elevations within the pit based on the mining plan, and including the proposed truck routes into and out of each pit.

8. Minor changes to the perimeter ECB and pit outline at the southwest area, due to the deletion of the Shania Twain Centre and slight relocation of the ECB to the southwest in this vicinity.

9. Updated ambient sound monitoring data at the Comfort Inn motel.

Porcupine Gold Mines (PGM), a joint venture between Goldcorp Canada Ltd. (51%) and Goldcorp Inc. (49%) (Goldcorp), has conducted feasibility level studies to determine the potential for re-developing the former Hollinger area, in Timmins, as a new open pit mine. For the purpose of this report, this undertaking is referred to as the Hollinger Project.

The former Hollinger Mine is located immediately adjacent to downtown Timmins and the urban area of Schumacher, on the south side of Highway 101. Ore from the proposed Hollinger Project would be processed at the existing Dome processing facility (Dome Mill), located approximately 5 km east of the former Hollinger Mine site. Considerable residual gold resources have been identified at the Hollinger Project Site, and development of the Site would have the added advantage of removing a number of known mine hazards (open stopes, mini pits, and near surface underground workings) that are associated with past activities.

The findings of this assessment are summarized as:

- The ECB will be provided at the perimeter of ultimate pit outline, and this assessment confirms this is necessary to reduce off-site sound exposures at the nearby noise sensitive areas, which mostly consist of detached dwellings, as well as an apartment building, motel, and extended care facility (to become non-noise sensitive but has been retained for this review). The maximum height that can be achieved for the environmental berm is limited at certain areas by existing property line restrictions.

- With the ECB fully constructed, regular mining processing operations can proceed throughout the daytime and nighttime. In a few cases at startup, when the pit operations will occur at the highest pit floor (bench) elevation, some restrictions to the amount of equipment operating within the pit may be required during the nighttime period, until the pit floor has adequately advanced to a greater depth. Once this point is achieved, the regular pit equipment compliment can resume operations during the nighttime period. This involves the startup for Millerton or Central pits only. Sections 7.1 and 7.2 summarize the operating stages where the potential equipment restrictions may apply, and the conditions allowing the restrictions to be removed while maintaining compliance with the applicable noise guidelines limits.

- A curbside barrier at the north and south sides of the haul road is needed. At the south side the height can be 2.0 -3.0 m above the road surface (this is the standard height to address safety issues of the haul trucks). At the north side of the haul road, the sections with closest approach to the residential areas will be provided with an 8.0 m high berm relative to the road surface for greater acoustical screening. The remaining sections will be the standard 2.0-3.0 m height required for safety reasons. The modelling is based on a 3.0 m high curbside barrier.

- Noise associated with the ECB construction during the initial stage of the mine is excluded from the MOE noise compliance requirements, and has not been considered as part of this review. Noise due to ECB construction is addressed in the Comprehensive Best Management Practices (BMP) report that forms part of the Site Plan development Agreement with the City of Timmins.

1.1 PREVIOUS ENVIRONMENTAL STUDIES

Valcoustics Canada Ltd. (VCL) has been involved with this project proposal beginning with the pre-feasibility stage, preparing the pre-feasibility environmental baseline study (Reference 1), as well as the feasibility study (Reference 2). Studies relating to mine blasting (air blast as well as ground vibration) were also completed at the pre-feasibility and feasibility stages (References 3 and 4).

The Reference 1 pre-feasibility study assumed a generic pit outline with perimeter environmental barrier, and various options for off-site storage of waste rock. The Reference 2 feasibility study was based on the initially proposed pit outline, and fence-line storage of waste rock (no off-site storage). Both studies concluded that meeting the applicable noise limits of the MOE was feasible for around the clock operations, with proper engineering design and adequate height of the perimeter environmental barrier.

2.0 SITE, AREA AND PROJECT DESCRIPTION

2.1 SITE HISTORY

Timmins was founded as a mining centre, with the three prominent original mines being the Hollinger Mine, the McIntyre Mine, and the Dome Mine. Of these, only the Dome Mine is still in operation.

The Hollinger gold deposit was discovered in 1909, as one of the three original major Timmins properties, along with that of the Dome and McIntyre Mines. The main Hollinger Mine operated from 1910 to 1968 and further mining took place in the 1970's and 1980's. The Hollinger, McIntyre and Coniaurum underground mine workings are all interconnected, along with those of a number of other smaller mines in the area. The McIntyre Mine operated from 1911 to 1988.

2.2 GENERAL SETTING

The Timmins area is characterized by a mix of urban and industrial development superimposed on a forested background. The City of Timmins consists of a major downtown urban area, as well as a number of other smaller urban centres scattered throughout the area, with Schumacher, South Porcupine, and Porcupine being the more prominent of these smaller centres. Various other smaller hamlets also occur throughout the area. All of these areas were amalgamated in 1973 to form the City of Timmins.

South Porcupine and other communities to the east are linked to Timmins by Highway 101, with a commercial strip occurring along this highway between downtown Timmins and Schumacher. Highway 655 extends north from Highway 101, with linkages to the Timmins airport via Airport and Laforest Roads, and linkages further north to Xstrata Copper's Kidd Mine site.

The Hollinger Project site is located in an urban area including residential, commercial and institutional uses, and is bounded by:

- Low density commercial and industrial uses, as well as some detached residential, along the west side, with primarily detached residential beyond.

- Industrial and commercial uses along the majority of the north side, including a residential apartment building at the western end, and a two storey motel (Comfort Inn) at the eastern end, with Algonquin Boulevard East (Highway 101) beyond. Commercial and industrial development is along the north side of Algonquin Boulevard, with several lakes and detached residential further north and northwest, as well as dormant mine tailings to the northeast.

- The residential community of Schumacher to the east, at the north side, including a nursing home at the west limit (the Extendicare Facility). The majority of the lands to the east are uninhabited.

- A trailer park (Fairway Village Trailer Park) along a portion of the south side with a small golf course opposite the western end (now decommissioned with the land owned by the Hollinger Project

operator), with Goldmine Road beyond. Further to the south, along the south side of Goldmine Road, are commercial and industrial uses, as well as another golf course. The Shania Twain Centre is located at the southwest side, but has recently closed and will be removed; the land being reclaimed by the Hollinger Project operator.

Figure 1 shows a Key Plan.

Appendix A includes a zoning plan. This can also be viewed online (Schedule 1 is the Key Plan, and Schedules 14, 15 and 17 show the site and surrounding area):

- http://www.timmins.ca/residents/building-planning/zoning-by-law.

2.3 PROJECT OVERVIEW

Goldcorp, through PGM, is planning to develop the Hollinger Project by redeveloping the former Hollinger area as a new open pit mine. The open pit mine would involve the sequential development of an open pit, through a series of phased push-backs that would be used to access shallow ore zones.

Development of the new Hollinger Project would require comparatively limited new infrastructure, as ore from the Project Site would be hauled to and processed at the existing Dome Mill to the east, with tailings from ore processing to be discharged to the existing Dome Mine tailings deposition area.

Under the current open pit design, there would be a requirement for the disposal of approximately 47,000,000 m^3 of mine rock. A portion of the mine rock (estimated at 10,000,000 – 15,000,000 m^3) is currently planned to be retained on the Hollinger Project Site and would be used to backfill and overfill the initially excavated phased mine pits. Rock and some overburden (approximately 2,000,000 m^3) will also be used to build the perimeter Environmental Control Berm (sound barrier) and the Transportation Corridor with the remainder being stored at the Dome Mine site.

Infrastructure used and/or developed to support the Hollinger Project would include:

- At the Hollinger Project Site:
  - site water collection and drainage systems (if required);
  - potentially some small fuel and petroleum product storage facilities (if required);
  - electrical connections from nearby, currently in place, Hydro One infrastructure; and
- Off the Hollinger Project Site:
  - the approximately 5 km long Transportation Corridor linking the Hollinger Project Site with the Dome Mill; and
  - additional mine rock stockpiles (at the Dome site).

In addition, the Project would include the construction of an Environmental Control Berm around the Hollinger Project Site. This is a key feature of the Project with the main purpose being to manage noise and other effects on nearby receptors.

During certain periods of the operations phase, mine rock material would be used to progressively backfill the phased mined pits. Excess rock will be stored off site, at the Dome site.

3.0 GENERAL SITE OPERATIONS

The materials to be removed from the open pit will include gold bearing ore and mine rock. The removal and processing of these materials will give rise to noise from associated equipment operations. Such sources will include in-pit drills for setting the explosive charges, pit excavators, loaders and shovels for loading the haul trucks as well as dozers and graders for maintaining the pit floor and access routes within the pit, as well as

a dedicated dozer to aid the backfilling operations, and haul trucks for transporting ore and mine rock along the transportation corridor. Water trucks and support/service vehicles will also be utilized.

3.1 GENERAL PIT PHASING

The current pit design envisions a large excavation at the top of the deposit, which will eventually focus down into three smaller sub-pits towards the bottom of the deposit. For planning and design purposes, these sub-pits have been named according to their general location within the project area. The excavation will occur in several distinct Stages over an anticipated nine year life span: these being the "92 Pit", the "Millerton pit", and the "Central pit". The noise modelling assumes the worst case approach where each pit phase is initiated close to grade (less overburden). Actual operations will involve initially excavating all three phases simultaneously, followed by each pit being excavated individually, with overlap occurring for two pits simultaneously.

The 92 Pit occupies the southern lobe and will be first to be fully excavated. The Millerton pit occupies the western portion and will be excavated in earnest once 92 Pit is finished. Central pit occupies the central and eastern portions of the ultimate outline, represents the bulk of the overall operations, and will be mined exclusively once the Millerton excavation is completed. Excavation of the various phases (pits) will be staggered in time, with some overlap occurring between the phases. The analysis accounts for the phasing of the excavating; that is, all excavation and associated noise producing activities occurring in one pit only at the beginning and end of the overall lifespan, as well as in two pits simultaneously for the years in-between. The specific operating scenarios considered for this assessment are presented in detail in Section 6.0 .

Full production capacity is assumed once the ECB has been completed, at least relative to the amount of equipment being used. That is, a phased or ramping production capacity and equipment has not been used for the initial regular operations. This is unlike the previous assessments, where a phased approach was considered.

Prior to the regular pit operations commencing, the perimeter ECB will be constructed in full. This will involve excavations from all three pit areas.

3.2 SITE PREPARATION AND OVERBURDEN

Normal site preparations will include the removal and stripping of overburden and other materials, and the building of support facilities, as well as constructing the ECB. The activities are not included as part of the regular pit operations.

3.3 MINE ROCK STORAGE

Prior to the regular operations, the mine rock with some overburden, will be used to build the perimeter ECB.

During the initial period of regular operations, the mine rock will be stored off-site, at the Dome site.

Once excavations are completed at 92 Pit and Millerton pit, the mine rock will be used for backfilling.

3.4 ENVIRONMENTAL CONTROL BERM (ECB)

As is discussed in subsequent sections of this report, an Environmental Control Berm or ECB will be needed around the periphery of the ultimate pit outline. This is primarily to reduce the noise emissions from the site operations at the nearby residential areas.

It is expected the ECB will take the form of berms constructed of mine rock, and suitable overburden material. At some areas the height will be supplemented by engineered sound barrier walls. The environmental control berm will be constructed in full prior to the regular pit operations.

Construction of the full ECB is expected to take the balance of one year to fully complete.

The construction of the ECB is not considered part of the regular operations noise, and is not considered in this assessment. This is addressed further in the Guidelines Section 4.5 below.

3.5 TRANSPORTATION CORRIDOR

The transportation corridor alignment between the pit and the existing processing plant at the Dome mine site as proposed by Goldcorp Canada Ltd-Porcupine Gold Mines has been used. The proposed alignment initially varies to the north side of the centreline of the open area between the site and the Dome mine, then regaining the centre line and furthest away from the site, as shown in the enclosed figures.

3.6 REGULAR OPERATING HOURS

Full production is planned to occur 24-hours per day, seven days a week.

This is planned once the ECB is fully completed as Stage 1 of the Project. To allow full 24-hour operations, it may be necessary to limit the amount of equipment during the nighttime period for certain operations. This would involve operations coinciding with the startup of certain pits.

Potential equipment restrictions during the nighttime period are discussed further in Sections 7.1 and 7.2 below.

3.7 NOISE MODELLING APPROACH

Using measured and/or manufacturers reference sound level data for the various equipment, and operating conditions considered as being worst case, sound exposures were predicted for each of the three pit phasing scenarios, including various combinations of the phasing scenarios, for the case with the full ECB present at the perimeter of the ultimate pit outline.

The existing site topography has been accounted for in the analysis (hills, valleys, vegetation, etc.) and assuming soft (sound absorbing) ground cover. The mature forested areas along either side of the transportation corridor were also accounted for, with exception of the areas cleared for the utility corridors.

The pit operations are based on the proposed bench elevations within the pit, and the operations scenarios presented in Section 6.0.

4.0 ENVIRONMENTAL NOISE GUIDELINES

The City of Timmins By-Law No. 1983-1998 provides only very general guidance in regard to regulating noise, and does not include sound level limits that must be met. This is often the case for municipal noise by-laws, and the noise guidelines of the MOE are typically invoked to address noise matters and establish appropriate sound level limits, in the absence of specific sound level limits in the municipal by-laws.

The MOE noise guidelines require that the noise assessment determine the “predictable worst case” effects. Thus, the assessment needs to evaluate the largest possible excess over the noise guideline limits based on the proposed operations in any hour of operation.

4.1 ON-SITE OPERATIONS (PIT AND MINE ROCK PILE)

Noise sensitive receptors requiring consideration are residential and similar seasonal/recreational dwellings, as well as hospitals, retirement residences and long-term care facilities, day cares, schools, etc. Under the MOE noise guidelines for stationary sources, there are no sound level limits for commercial/office uses.

The areas within the zone of influence around the pit and mine rock piles are considered “Class 2” areas, according to MOE definition. A Class 2 Area is an area that has qualities representative of both Class 1 (urban) and Class 3 (rural) areas, specifically, where the sounds of man are dominant during the daytime, and in which a low ambient sound environment defined by natural environment and infrequent human activity

typical of a rural environment typically occurs during the evening and nighttime (see Glossary of Terms for definitions of Class 1, Class 2 and Class 3 areas). This is certainly true for the locations in the built up areas, but also applies to the residences along Goldmine Road, due mostly to the road traffic sources frequently audible on this road.

The site, and it's potential zone of influence, fall within the City of Timmins urban boundary.

The appropriate environmental sound level guidelines are found in the MOE Publication NPC-205, *"Sound Level Limits For Stationary Sources In Class 1 and 2 Areas (Urban)"*. For a Class 2 Area, the sound from the source (L_{eq} in any hour) should not exceed the existing ambient one-hour L_{eq} at the receptors of concern, for any of the hours coinciding with the site operations. The acoustical descriptor L_{eq} is the Energy Equivalent Continuous Sound Level, which is an averaging of the sound energy over a defined time period. The time period referenced in the MOE guidelines is one-hour.

Notwithstanding the above, for a Class 2 Area, no mitigation is required for any source that does not exceed 50 dBA (one-hour L_{eq}), at any off-site receptor of concern between the hours of 0700 and 1900 hours. Between 1900 and 0700 hours, the limit is 45 dBA. The 45 dBA and 50 dBA limits are referred to as the "minimum exclusion" limits. The applicable guideline limit defaults to the higher of the exclusion limit values, or the existing ambient sound exposure, whichever is higher.

Please note that the MOE terminology "stationary source" refers to the site as a whole, including the composite effect of all of the individual sound sources, even if the latter can actually move around the site. Thus, source, as referred to above, means the site (operation) as a whole, including mobile machinery.

4.2 TRANSPORTATION CORRIDOR

There are no specific statutes, regulations, formal policies under the Planning Act or guidelines applicable to adding licensed motor vehicles to public roadways and dealing with noise. However, the new transportation corridor will not be part of any public roadway system. The transportation corridor is considered as being part of the stationary source and is therefore subject to the same criteria and conditions as noted in Section 4.1 above.

To summarize, the applicable sound level limits for the site operations and transportation corridors are:

- Daytime (0700 to 1900 hours): 50 dBA (or the existing ambient if higher); and
- Evening and Nighttime (1900 to 0700 hours): 45 dBA (or the existing ambient if higher).

4.3 EXISTING SOUND ENVIRONMENT

To establish the applicable sound level guideline limits, staff of VCL visited the area from July 17 to 21, 2007, as part of the pre-feasibility (Reference 1) studies. The purpose of the visit was to identify noise sensitive areas potentially affected by operations at the pit, waste pile and transportation corridor options, and to measure and qualify the existing sound environment at these representative noise sensitive areas.

The noise monitoring locations and measured sound levels are summarized in Appendix B1.

Figure B1.1 shows the sound monitoring sites, and location descriptions. These sites include locations where long-term unattended noise monitoring measurements were made continuously over a period of approximately 24 to 40-hours, with a few exceptions where the duration of measurement was slightly less than 24-hours due to logistical constraints. Regardless, the long-term monitoring included the critical 1900 to 0700 hour evening/nighttime period in all cases, which is when the lowest ambient sound levels typically occur, and thereby defining the governing sound level limit for continuous round-the-clock operations. Measurement intervals of 60 minutes were used for the long-term monitoring. A series of short term (minimum 20 minute) spot measurements were also made at various times on different days for other locations. The MOE considers a minimum 20 minute sound exposure as being representative of the full 60 minute (hourly) L_{eq}.

The monitoring locations were originally chosen to coincide with potential design options being considered at the time of the pre-feasibility studies for off-site storage of mine rock (Reference 1 study). This included mine rock storage areas north of Algonquin Boulevard (Highway 101), and the closest residential (or other noise sensitive uses) to those storage areas. These mass off-site storage areas for mine rock are no longer being considered, and the receptor locations furthest away from Algonquin Boulevard are no longer relevant to this assessment, since the other receptor locations are much closer to the pit area(s) and transportation corridor to the Dome site. The southern-most of these receptors north of Algonquin Boulevard are still somewhat relevant due to the potential influence from the pit. This study retains the noise monitoring results for all receptor locations for simplicity and as a matter of interest.

Several of the noise monitoring sites in Figure B1.1 show two id's for a single location. This is simply an artifact of the previous pre-feasibility assessment nomenclature used, and due to the various options for off-site mine rock storage being considered at that time, where two options affected a given receptor.

Table B.1 summarizes the ambient measurements for all locations in Figure B1.1. The levels reported for the long-term noise monitoring sites are the one-hour period where the *minimum* sound level occurred throughout the 0700 to 1900 hour daytime period, as well as the 1900 to 2300 hour evening and 2300 to 0700 hour nighttime periods. Since the mine operations may potentially be around-the-clock, the minimum levels define the applicable guideline limits, provided these levels are not below the "exclusionary limits" noted in Section 4.1 above.

Various acoustical parameters were measured, including the sound exposure in terms of the L_{eq} (the Energy Equivalent Continuous Level), and various L_n values (i.e., the sound level exceeded for a certain percentage of the time for each measurement interval, for example the L_{90} is the sound level exceeded for 90% of the time during the one-hour long interval, which is representative of the "noise floor" for a time varying sound level). The L_{max} and L_{min} were also measured (the maximum and minimum sound level occurring for each interval). For simplicity, only the L_{eq} is reported in Table B.1. The L_n values can be important when qualifying the acoustical environment, but are not integral to the noise guideline limits. All acoustical descriptors measured at the long-term sites are included in Appendix A of the Reference 1 report, and are not reproduced here. The raw measurement files for the short-term sites are very numerous and are not included in this report, but can be provided if necessary.

The measurements at the long-term monitoring sites were made using a General Radio 1" condenser microphone with General Radio Type 1560-P42 pre-amplifier connected to a Metrosonics dB 604 precision sound level analyser. The system was calibrated for each measurement location using a Larson Davis Model CA250 precision acoustic calibrator. The dB 604 analyser included a tripod mounted wind anemometer to inhibit the measurement acquisition for wind speeds greater than approximately 20 kph. The short term (spot) measurements were made using a Larson Davis 824 Precision Sound Level Meter, and calibrated using a Brüel and Kjaer 4231 acoustic calibrator. All microphones were equipped with wind screens. The measuring microphones were mounted on tripods 1.5 m above the existing grade, except at one location (the hospital at the west side of Highway 655) where the tripod was mounted atop an approximate 2.0 m high rock outcrop. This location was used to better represent ambient sound levels at the upper floors of the hospital.

All sound measurements were made in accordance with MOE NPC-103 *"Procedures"*. The weather conditions throughout the measurements were favourable, with light winds and no precipitation. Appendix B2 includes the weather data for the July 17 to 21, 2007 period, as recorded at the closest weather station (Timmins), the raw measurement files are not reproduced here.

4.3.1 Receptor Locations Close to Algonquin Boulevard

Sound monitoring measurements have been used to help establish the applicable criteria at the apartment building and the motel at the south side of Algonquin Boulevard.

4.3.1.1 February 24 to 27, 2012 Sound Monitoring - Apartment Building (Weekend Condition)

Long term sound monitoring was completed over a weekend period at the apartment building (receptor R03), from 1300 hours Friday February 24 to 1100 hours Monday, February 27, 2012. The apartment is considered a critical receptor due to the top floor elevation being much higher than the other receptors close to the pit, and potential for reduced screening by the ECB.

The measuring microphone was mounted at the end of a truck mounted boom to coincide approximately with the top (9^{th}) floor of the apartment building, at the south face furthest from the adjacent Algonquin Boulevard where the lowest ambient sound exposures would be expected. Attempts were previously made in April 2011 to gain access to the apartment to undertake long term ambient sound monitoring measurements but access/cooperation proved too difficult to obtain. Appendix E includes a copy of this request letter.

The boom truck was off throughout the measurements with exception of a few minutes on Sunday, February 26 at 0033 hours to adjust the boom height (when off, the hydraulic boom will lower slightly in elevation over a long period). In this case the boom had lowered approximately 4 feet relative to the initial height (per Reference 13). This brief period with the truck engine operating did not effect the conclusions of the ambient monitoring.

Figure F1 in Appendix F shows the sound measurement location. Appendix F also shows the raw sound measurement data as well as the plotted time history, and the weather data during this period which was favourable.

The chart below summarizes the measured hourly sound exposures (L_{eq}) for the daytime and evening/nighttime periods, in terms of the range minimum / maximum for the period.

Summary of February 24 to 27, 2012 Sound Monitoring Data at Receptor R03 Apartment Building:

Period	Hourly L_{eq} (dBA)	Note
Day (0700 - 1900 hours)	58 to 64	excludes initial and final one-hour periods (startup and removal)
Evening/Night (1900 - 0700 hours)	51 to 62	the one-hour period from 0000-0100 February hours includes a brief (less than 5 minute) startup of the boom truck engine used to mount the measuring microphone but this period did not determine the maximum sound 62 dBA hourly level shown.

The sound environment is dominated by road traffic sources on Algonquin Boulevard, as well as sounds from the existing industry immediately south of the apartment. Prior to conducting the sound measurements, the City of Timmins as well as the District MOE office was sequestered to ensure there were no on-going noise complaint investigations or orders to comply in relation to noise emission from any of the industrial or commercial businesses in the immediate area of the apartment. The City and MOE confirmed there are no outstanding compliance orders or current investigations (References 14 and 15).

4.3.1.2 Recent Sound Monitoring At Comfort Inn Motel

The mine operator has committed to a permanent sound monitoring system to measure sound levels at critical locations close to the pit perimeter. This system has been operational for many months, including a location immediately south of the Comfort Inn motel (receptor R14). This location is representative of the sheltered (southern) face of the motel which is the worst case location, due to the lowest ambient (sheltered from Algonquin Boulevard) but with full exposure to the pit immediately south.

The sound monitoring data for a continuous 12 day period was considered, from 1200 hour Monday, November 11 to 0700 hours Friday, November 23, 2012, and excluding any noise contribution from the Hollinger Project. The numeric average of the minimum hourly sound levels occurring during each of the 0700 to 1900 hour daytime period, 1900 to 0700 hour nighttime period, was determined.

The average of the one-hour sound exposure minima occurring during this 12 day period were:

- Motel (R14): 53 dBA daytime, 44 dBA evening / nighttime.

Appendix G shows the monitoring location (Figure G1). The raw measurement data is also included in Appendix G.

4.4 APPLICABLE GUIDELINE LIMITS

The sound monitoring measurements in Table B.1 confirm that the exclusionary limits apply to the majority of the closest locations potentially affected by the undertaking; that is:

- 50 dBA for the (0700 to 1900) daytime period; and
- 45 dBA for the (1900 to 0700) evening / nighttime periods.

The exception occurs for the apartment building (R03) adjacent to Algonquin Boulevard, as well as the Comfort Inn Motel during the daytime where the following limits apply (based on the sound monitoring measurements made and summarized in Section 4.3.1.1 and 4.3.1.4, and the minimum hourly sound exposure occurring during the daytime and evening/nighttime periods, and applicable MOE exclusion limit during the nighttime for the Comfort Inn):

Apartment Receptor R03:

- 58 dBA for the (0700 to 1900) daytime period; and
- 51 dBA for the (1900 to 0700) evening/nighttime period.

Comfort Inn Motel R14:

- 53 dBA for the (0700 to 1900) daytime period; and
- 45 dBA for the (1900 to 0700) evening/nighttime period.

The previous (2007) ambient sound monitoring measurements at the residential area immediately west of the pit (monitoring Site P-3) suggest background sound levels slightly higher than the exclusion limits, at least for the daytime periods when the samples were taken, but this is not supported by the long-term measurements made nearby at the Allied Steel yard (monitoring Site P-5). The higher levels at P-3 were influenced by close pass-bys of vehicles on Shania Twain Road. Longer duration samples, and measurements for periods when the Shania Twain Centre was closed, show much lower sound levels. The minimum exclusion limits therefore seem to apply for the residential areas opposite the west boundary.

4.5 CONSTRUCTION NOISE

Item (2) "Excluded Sources" in Section A.3 of Annex to Publication NPC-205, *"Sound Level Limits For Stationary Sources In Class 1 and 2 Areas (Urban) "* October 1995, states that noise due to construction activities is excluded from compliance with the numerical sound level limits in NPC-205.

For this site, the building of the sound barrier berms, removal of overburden and mining of rock during the berm construction period and for berm construction material and construction of the transportation corridor are by definition a construction activity. Therefore, noise from these construction activities is not included in the predictions addressing the regular day to day operations. Relatively speaking, the construction activities are short duration events and the noise associated with these events are normally not a concern, or at least

are considered as being tolerable in the short term. In addition, most of the construction activities will (or can) be restricted to the daytime hours, to minimize the potential noise effects.

The MOE do have noise guidelines to address construction noise, but amount only to instantaneous sound level limits at a fixed reference distance from one piece of construction equipment. These sound level limits are summarized in MOE Publication NPC-115 *"Construction Equipment"*. Complying with the instantaneous sound level limits of NPC-115 does not ensure compliance with the NCP-205 guideline limits by default.

Potential noise impacts related to construction activities and methods to address and minimize these impacts are addressed in the Best Management Practices plan (Reference 12). Estimated time frames for construction related noise have been addressed in response to MOE review comments. See Section 7.3.6 below.

4.6 MOE D-1 AND D-6 LAND USE COMPATIBILITY GUIDELINES

The MOE D-1 and D-6 guidelines are intended to assist in the planning process when new sensitive land uses are proposed within the potential influence area of existing facilities, or when new facilities are proposed where existing sensitive uses would be within the new influence area. The stated objectives of the MOE guidelines are to *"...minimize or prevent, through the use of buffers, the exposure of any person... to adverse effects associated with the operation of specified facilities..."*. Environmental noise is one identified, potential, adverse effect.

Separation distance is one buffering technique. Other types of buffers or mitigation are recognized, such as sound barrier berms, walls or buildings. Where a specific site is proposed for development, it is the proponent's responsibility to investigate, propose and implement mitigation that can be located either at the source, elsewhere on the facility site, on the sensitive land use site, or on intervening sites.

The D-6 guideline is a direct application of D-1, specific to industrial operations/facilities and sensitive land uses.

Guideline D-6 identifies potential separation distances between sensitive land uses and industry, based on categorizing industry into one of three classes.

Class I:	potential zone of influence 70 m; minimum 20 m.
Class II:	potential zone of influence 300 m; minimum 70 m.
Class III:	potential zone of influence 1000 m; minimum 300 m.

The setbacks are typically lot line to lot line. Where zoning setbacks preclude uses with a potential for conflict, setbacks on source or receptor properties can be part of the minimum setback.

There are several pit-falls in the literal application of Guideline D-6:

- The D-1 and D-6 guidelines are broad guidelines considering a variety of potential environmental effects, including noise, vibration, air quality, etc. Distance separation alone is generally not an efficient mitigation technique for noise or vibration, because of the non-linear relationship between sound level and distance from a source. That is, the rate of fall off of sound level diminishes with increasing distance. Thus, relying on distance alone can lead to inefficient use of infrastructure and available land. Including mitigation such as sound barriers, building orientation, or noise control at source (e.g., equipment selection, silencers on fans, etc.) can often lead to appropriate compliance with noise criteria and land use compatibility, using separation distances less than the minimum in the D-6 guidelines.

- Applying the minimum recommended (or other arbitrary) separation distance provides no assurance there will be no significant environmental effects and that no mitigation will be required. There have been occasions where planners assumed that implementing either the minimum or a separation

distance equal to the indicated potential zone of influence automatically resolved all issues. This cannot be automatically assumed. Conversely, there are examples where noise sensitive developments have been approved with buffer setbacks much less than the minimums under D-6, on the basis that the applicable MOE noise guideline limits of LU-131 or NPC 205/232 are met. In other words, compliance with the numeric sound level limits of the MOE can be a better predictor of land use compatibility, rather than buffer setbacks alone and in the absence of numeric sound limits.

In general, compliance with the numeric sound level guideline limits outlined in MOE publications LU-131 or NPC 205/232 have been adequate to demonstrate land use compatibility between industrial facilities and noise sensitive uses, for buffer setbacks less than the suggested minimums outlined in the D-1 and D-6 publications.

5.0 ASSESSMENT RECEPTORS

This update now accounts for discrete receptor locations as previous, as well as sound level contours .

Figure 2 shows the individual assessment receptors considered in this assessment.

Individual receptor locations were used in this assessment to assess the noise levels with accounting for the proposed noise mitigation, and to demonstrate compliance with the noise guideline limits. In addition, sound level contours superimposed on a scaled aerial image were have also been used to assess the potential effects at the closest noise sensitive areas, for all of the operating scenarios considered. The sound level contours are included in this report.

The receptors and heights used in the analysis are as follows:

- Receptor R01: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R02: long-term care facility, 7.5 m above grade (top third floor window) – see also Note 1 below;
- Receptor R03: apartment building, 25.5 m above grade (top 9th floor window);
- Receptor R04: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R05: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R06: mobile home, 2.5 m above grade (elevated first floor window);
- Receptor R07: mobile home, 2.5 m above grade (elevated first floor window);
- Receptor R08: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R09: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R10: detached dwelling, 4.5 m above grade (second floor window) – see also Note 2 below;
- Receptor R11: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R12: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R13: detached dwelling, 4.5 m above grade (second floor window);
- Receptor R14: motel, 4.5 m above grade (second floor window).

Note 1 regarding R02: The Extendicare facility has an agreement to be purchased by the mine operator, and a new long-term care facility will be established elsewhere. The existing Extendicare building will remain, but will be used as offices for the Hollinger Project. This change in use will then exclude this building as a noise sensitive receptor. For the purposes of this review, this location has been retained as a noise sensitive receptor.

Note 2 regarding R10: This receptor location has been relocated relative to the previous submission(s). The original location did not actually coincide with a dwelling, but did coincide with a (representative) sound monitoring location when undertaking the ambient sound level survey. The original measurement location close to a dwelling was adversely affected by local ambient noise sources and was relocated to a point just east of the subdivision and away from the local unrelated sound sources, to obtain lower (worst case) ambient data. The revised assessment location used for this update now coincides with dwellings at the southern portion of the subdivision and closest to the transportation corridor.

In general, the relevant noise sensitive areas potentially affected by the anticipated operations noise at the pit, mine rock stockpiling and transportation corridors are:

- Open Pit:
  - The detached dwellings along the east side of Railway Street and east side of Laidlaw Street (as well as the detached dwellings to the west of these); i.e., the dwellings immediately west of the general pit area, represented by receptors R04, R05.
  - The residential mobile homes and trailers at the Fairway Village Trailer Park, immediately south of the pit area, represented by receptors R06, R07.
  - The residential apartment building, and the Comfort Inn motel, at the south side of Algonquin Boulevard East (Highway 101), immediately north of the pit area, represented by receptors R03, R014.
  - The detached dwellings and institutional building (Extendicare long-term care facility) along the southwest periphery of the Schumacher urban area immediately northeast of the pit, represented by receptors R01, R02.
- Mine Rock Storage (backfilling pits within the fence-line):
  - Same locations as noted above for the open pit.
- New Transportation Corridor:
  - The existing detached dwellings along the north side of Gold Mine Road, opposite the south side of the transportation corridor, represented by receptors R08, R09.
  - The detached dwellings along the south periphery of the Schumacher urban area, as well as the southern periphery of the Gold Centre subdivision east of Schumacher area, all being opposite the north side of the transportation corridor, represented by receptors R01, R02, R10, R11.

Several of these receptor locations coincide with the ambient noise monitoring sites in Figure B1.1.

As noted previously, the MOE noise guidelines do not apply to commercial or office uses. However, due to the close proximity of the noise sensitive areas to the existing commercial development, ensuring appropriate sound levels at the noise sensitive areas should also ensure appropriate sound levels at the commercial uses by default.

6.0 DATA ANALYSIS

6.1 SITE OPERATIONS AND OPERATING SCENARIOS

6.1.1 General Site Operations

The regular site operations form a complex sound source. A pit operation is a dynamic, continually changing process, that moves across and around the site. The primary noise producing activities are:

- operations in the pit associated with the extraction of mine rock and ore;
- hauling ore bearing material to the existing processing facilities at the Dome Mine site via a new transportation corridor, as well as mine rock to the Dome site; and
- activities associated with backfilling the excavated pits.

Construction activities, such as the stripping of overburden, and building the perimeter ECB are not included in the assessment in accordance with MOE guidelines (construction activities are an 'excluded' source).

The worst case condition generally occurs where all operations occur at (close to) the existing grade.

6.1.2 Base Operating Scenarios

A main distinction between the previous report (Revision 1) and this update (Revision 2) are the operations scenarios considered. Although the general underlying intent of excavating 92 Pit initially, then Millerton pit and followed by Central pit is retained, the potential for flexibility has also been considered. This has been addressed by investigating any single pit to be excavated individually during a specific operating Stage, or any two pits simultaneously for various operating Stages. This approach allowing for any single pit or any two concurrent pits at times, significantly increases the number of potential operating scenarios.

Table 1 Summarizes the base Operating Scenarios (Stages), and other information relevant to this noise review such as bench (pit floor) elevation, equipment assignments, production capacity, as well as the correlation to the analysis scenario id used in the CadnaA noise model. The Operating Scenarios are described as:

- 92 Pit area at initial phase of development;
- 92 Pit area at advanced phase of development plus Millerton pit area at initial phase of development;
- 92 Pit area at advanced phase of development plus Central pit area at initial phase of development;
- 92 Pit area at final phase of development;
- Millerton Pit area at initial phase of development;
- Millerton Pit area at initial phase of development plus Central pit area at initial phase of development;
- Millerton Pit area at advanced phase of development plus Central pit area at initial phase of development;
- Millerton Pit area at final phase of development;
- Central Pit area at initial phase of development; and
- Central Pit area at final phase of development.

Construction of the ECB and removing overburden precedes these Operating Scenarios and are not included in the assessment (construction noise emissions are excluded and have not been reviewed).

For all of the Operating Scenarios:

- all trucks hauling waste rock and all trucks hauling ore travel to and from the Dome site along the transportation corridor;
- the full equipment compliment is active within the pits, with some minor exceptions for two startup conditions where a slightly reduced equipment contingent may be necessary (see Section 7.0 below).

6.1.3 Backfilling Operations Scenarios

Backfilling will occur for 92 Pit as well as Millerton pit, when excavations at these pits are completed. It has been assumed that the hauling of all waste rock is diverted from the Dome site and is used instead for backfilling the pits.

For 92 Pit:

- backfilling is expected to start on or around Stage 4 (year 4) when 92 Pit is completed, and ending in Stage 5 (year 5) or slightly later;
- two cases have been reviewed, allowing for (I) the initial condition when backfilling starts with 92 Pit floor elevation at the lowest point (226 m), and (ii) the final condition when backfilling ends with the 92 pit floor elevation at the highest point (286 m). The floor elevation within Millerton pit also changes (decreases) from (I) to (ii);
- as a worst case condition, all waste rock trucks are assumed to be diverted from hauling waste rock to the Dome site, and instead are used to transport waste rock from Millerton pit into 92 Pit;
- there are no changes to the number of ore haul trucks on the transportation corridor; and
- one additional dedicated dozer is accounted for at 92 Pit, to help with maintaining and distributing the backfill.

Similarly, for Millerton pit:

- backfilling is expected to start on or around Stage 6 (year 6) when Millerton pit is completed, and ending in Stage 7 (year 7) or slightly later;
- two cases have been reviewed, allowing for (I) the initial condition when backfilling starts with Millerton pit floor elevation at the lowest point (220m), and (ii) the final condition when backfilling ends with Millerton pit floor elevation at the highest point (268m). The floor elevation within Central pit also changes (decreases) from (I) to (ii);
- as a worst case condition, all waste rock trucks are assumed to be diverted from hauling waste rock to the Dome site, and instead are used to transport waste rock from Central pit into Millerton pit;
- there are no changes to the number of ore haul trucks on the transportation corridor; and
- one additional dedicated dozer is accounted for at Millerton pit, to help with maintaining and distributing the backfill.

6.2 EQUIPMENT ASSIGNMENTS AND EQUIPMENT REFERENCE NOISE LEVELS

6.2.1 Significant Sources

Table 2 summarizes the specific equipment assignments used in the analysis.

Table 3 shows the noise source summary.

The main noise producing equipment sources and activities at the pit are based on the following:

- one (1) CAT 992 wheeled loader;
- two (2) CAT D9/D10 dozers;
- one (1) CAT D9/D10 dozer – dedicated for backfilling;
- two (2) Hitachi 2500 excavators;
- two (2) CAT 385 excavators;
- two (2) CAT 16M Graders;

- one (1) Cubex Drill
- seven (7) Smartrock Drills; and
- one (1) CAT 777 water truck (pit dedicated).

It is assumed all pit equipment can be operating simultaneously at any given time, which presents a worst case assessment condition.

The drills used will be "down the hole" impact type drills, where the drill hammer is past of the drill head and is confined to the drill hole, where the noise from drilling is suppressed. The noise emissions at the surface are associated with the engine that powers the drill.

The main noise producing activities associated with the transporting of mine rock is based on the following:

- up to fifteen (15) CAT 785 haul trucks (per hour) transporting waste rock out of the pit to the Dome site, or to fill the previous fully excavated pit (backfilling);
- up to seven (7) CAT 785 haul trucks (per hour) transporting ore from the pit to the Dome processing plan; and
- one (1) CAT 777 water truck (dedicated use on the transportation corridor).

A utilization of 90% was assumed for all equipment (typical), except the crusher at the Dome processing plant where 100% was assumed, as well as the haul trucks, which is based simply on the number of total truck pass-bys per hour.

6.2.2 Equipment Reference Sound Emission Levels

On-site sound measurements following acoustical standard SAE J88 were completed for the following equipment sources:

- CAT 992 wheeled loader;
- CAT 785 haul truck;
- CAT D10 dozer;
- CAT D9 dozer;
- CAT 385 excavator;
- CAT 16M grader;
- Hitachi 2500 excavator;
- Cubex drill; and
- Smartrock drill.

In all cases the sound power levels derived from the site measurements were less than the manufacturers sound ratings by 3 to 12 dB. The heavy equipment sources were lower by 3 to 10 dB, with the drills being lower by 6 to 12 dB.

The as-measured sound ratings have been used for this update analysis. The report summarizing the sound measurements and derivation of the reference sound power levels is included in Appendix H.

Site sound measurements were not done for the CAT 777 water truck. The manufacturers sound rating has therefore been used.

Table 3 summarizes the equipment sound ratings.

6.2.3 Equipment Source Heights

The following source heights have been used: 2.0 m above grade for all sources except the haul trucks at 2.5 m and the crusher (Dome site) at 3.5 m.

These source heights are considered representative in terms of the blending of the primary noise sources for each equipment, including the exhaust stack, the engine casing and radiator fan, and in the case of the dozers (and wheeled vehicles to a lesser degree), the noise from the tracks (or wheels) on the hard driving surface.

6.2.4 Transportation Corridor Haul Truck Volumes

For the regular operations initiated once the ECB is completed, at full capacity, seven haul trucks (ore) and 15 haul trucks (waste rock) per hour are expected, translating into 22 (7 + 15) trucks in one hour. This can be thought of as 22 trucks arriving *and* departing within a one-hour window (e.g., one-hour round trip) or a fewer number of trucks arriving and departing with a shorter round trip (i.e., with a shorter round trip, fewer trucks are needed to maintain the same truck arrival and departure frequency, and same production rate). As operations progress, the ratio of ore to waste rock trucks may vary, but the total number of truck movements is assumed to remain the same.

The number of haul trucks/hour noted above is the *total* number of trucks. The analysis is based on total movements/hour or pass-bys/hour at any given point along the truck route, in either direction, which is twice (2x) the number of trucks/hour. This assumes all trucks depart and arrive during the same one-hour assessment window. For 22 haul trucks arriving and departing in one hour, the total number of movements is 2 x 22 = 44 trucks/hour.

One water truck is dedicated to the transportation corridor. In the same fashion, it is assumed the water truck also arrives and departs in one hour, that 2 x 1 = 2 water trucks/hour.

The haul trucks (waste rock and ore) also travel into and out of the pits, but are not considered as dedicated pit equipment sources.

6.2.5 Non-Significant Sources

In clarification of questions put forth by the MOE as part of their review of the previous AAR report submissions:

- there will be no screening in the pit;
- there will be no wash plant in the pit;
- there will be no generators in the pit, emergency or otherwise (electrical power will be available for the energy needs); and
- hoe rams will not be used as part of the drilling process. Oversized rock will initially be drilled and then blasted, or transported to the Dome (processing) site where it will be broken while feeding it to the primary crusher.

6.3 ACOUSTIC MODELLING

The sound exposure predictions were made using CadnaA, 3-D acoustical modelling software and the scaled aerial plan. Site topography was accounted for, both within the site boundary as well as outside of it. This model was used to predict the site generated sound exposures at each of the receptor locations, accounting for distance attenuation, ground attenuation and inherent screening by environmental (sound barrier) berms for the mitigation case. All fixed or stationary noise sources were modelled as point sources radiating sound energy into a hemisphere. The haul truck movements were modelled as line source segments.

The pit equipment was assumed to be fairly evenly distributed around the pit floor.

The sound level data used in this analysis is summarized in Table 3 and Appendix C. Equipment replacements will possibly occur during the life of the operations. Some of the equipment models may differ from that noted, and the replacement equipment is expected to be quieter than that currently allowed for.

To address the worst case condition, it was assumed that all of the equipment noted in Section 6.2.1 operates simultaneously around the clock. Possible exceptions for two startup conditions are noted in Section 7.0.

The sound exposures at each receptor location were initially predicted assuming the ECB is fully constructed, and assuming operations during the daytime and nighttime. Control measures were then investigated to determine the location, type and degree of any additional noise mitigation measures necessary to demonstrate compliance with the daytime and nighttime sound level limits. As noted, this generally amounted to considering a reduced amount of equipment until such a time that an adequately low bench elevation is reached, allowing resumption of the full equipment compliment during the nighttime.

The AutoCAD plans for all year by year stages of the evolution of the pit were made available by the mine operator. This includes the bench elevations within the pit , as well as access roads and ramps into the pit, showing actual grade elevation coordinates. The same was also provided for the ECB for current (final) configuration. This information was imported into the CadnaA noise model, to allow true modelling for all future operating conditions and stages. No assumptions regarding anticipated pit floor advance rate, expected pit floor elevations, access road locations and grades, and estimated depth of overburden have been necessary: all proposed grading information for the pits and ECB has been incorporated into the noise model.

The mining plan identifies the pit floor (bench) elevations throughout the pit life with a fairly fine time resolution corresponding to a bench-to-bench change of 6.0 m. The analysis conditions used in this assessment are for start of year conditions. To ensure the worst case conditions are presented, the end-of-year bench elevation has been used for the start-of-year analysis condition. This ensure the higher (worst case) bench elevation is used in the analysis.

6.3.1 Environmental Control (Sound) Barrier (ECB)

Based on the results from the Reference 2 feasibility noise assessment study, detailed design of the environmental control berm was undertaken (by others). The detailed design accounts for the height objectives noted in the Reference 2 report, space restrictions affecting the maximum allowable width of the berm at the base, and other factors such as adequate width (flat) atop the berm to accommodate vehicles such as watering trucks for dust control. All of these were used to generate a proposed profile for the environmental berm.

The berm design used in this update is the most current, accounting for a slight revision at the Shania Twain Centre (the berm has been moved to the southwest slightly, occupying the current location of these existing buildings). It is not expected there will be any further substantive changes to the ECB.

The ECB will be fully constructed prior to the regular mine operations being initiated.

6.3.2 Transportation Corridor Curbside Barrier

The transportation corridor will include curbside barriers along the north and south sides of the corridor. These are to prevent the haul trucks from accidentally leaving the roadway, and are constructed of mine rock, typically about 2.0-3.0 m above the road surface (3.0 m has been used I the modelling).

Along the north side, an increased 8.0 m height is planned in the vicinity of the residential areas to the north, for greater acoustical screening. The extent of the 8.0 m high section is shown in Figure 2.1. Elsewhere, the standard 3.0 m high berm is shown to be sufficient.

7.0 ANALYSIS RESULTS AND NOISE CONTROL MEASURES

Accounting for the ECB fully constructed, the modelling predictions indicate the daytime and nighttime sound levels limits will be satisfied at all assessment receptor locations, for all Operating Scenarios, and including the backfilling operations. The two exceptions are:

- startup condition for Central pit, for all excavation occurring within this pit only, during the nighttime (occurring in Late Stage 2 when Central pit excavations will certainly begin); and
- startup condition for Millerton pit, for all excavation occurring within this pit only, during the nighttime (occurring in Late Stage 2 when Millerton pit excavations will certainly begin).

Control measures to address the Millerton and Central pit startup conditions are discussed below.

Table 4 summarizes the predicted sound exposures at all receptor locations for all operating scenarios.

Tables 5.1 to 5.19 show the point of reception summary tables for the operations scenarios, and Tables 5.20 to 5.23 show same for the backfilling scenarios.

A sample calculation is included in Appendix D.

7.1 EQUIPMENT RESTRICTION CONSIDERATIONS FOR MILLERTON PIT STARTUP CONDITION

Assuming 100% of the pit equipment is active at Millerton pit, the analysis shows the potential for an insignificant 1 dB excess over the nighttime guideline at the dwellings to the southwest and south (R05 and R07). The daytime guideline limit is met.

Consideration has been given to initially reducing the amount of equipment active within Millerton pit for this case, as a method to reduce the sound emissions off site and allow nighttime operations. The modelling confirms the 45 dBA nighttime guideline can be met based on the following example reduction of pit equipment sources:

- 1 x Cubex drill is off;
- 1 x Hitachi 2500 shovel is off
- 1 x dozer is off.

This represents a reduction of three of the total dedicated 18 pit equipment sources. Other equipment reduction combinations would also be possible. This reduced equipment condition is included in the enclosed Table 4 and 5 series summaries, as well as Figure 8, for the Year 2 - Late Stage 2 Case 2 condition (modelling scenario 6).

The full (100%) pit equipment compliment can be reinstated with the 45 dBA compliance level being met for a pit floor (bench) elevation reduction of 6.0 m, that is, Millerton pit floor elevation = 310 m.

7.2 EQUIPMENT RESTRICTION CONSIDERATIONS FOR CENTRAL PIT STARTUP CONDITION

Assuming 100% of the pit equipment is active at Central pit, the analysis shows the potential for an insignificant 1 dB excess over the nighttime guideline limits at the apartment building and the motel opposite the north side of Central pit (R03 and R14). The daytime guideline limit is met.

Consideration has been given to initially reducing the amount of equipment active within Central pit for this case, as a method to reduce the sound emissions off site and allow nighttime operations. The modelling confirms the applicable nighttime guideline limits can be met based on the following example reduction of pit equipment sources:

- 1 x Cubex drill is off;
- 2 x Smartrock drills are off;
- 1 x Hitachi 2500 shovel is off
- 1 x CAT 385 excavator is off;
- 1 x dozer is off.

This represents a reduction of six of the total 18 pit equipment sources. Other equipment reduction combinations would also be possible. This reduced equipment condition is included in the enclosed tables and Figure 9 for the Year 2- Late Stage 2 Case 2 condition (modelling scenario 7).

The full (100%) pit equipment compliment can be reinstated with the nighttime compliance level being met for a pit floor (bench) elevation reduction of 12 m, that is, Central pit floor elevation = 322 m.

Figures 3 to 19 show the hourly sound exposure predictions and including the pit equipment reductions noted above for the Millerton pit startup condition (Figure 8) and for the Central pit startup condition (Figure 9). Figures 20 to 23 show the backfilling operations summary described in Section 6.1.3 above.

The sound level contours are also shown in Figures 3 to 18. The contour applies to a height 4.5 m above the local grade elevation. This height coincides with the upper (2^{nd}) floor for the majority of the dwellings in the area, but does not necessarily reflect the height of other assessment receptors, such as the apartment building (R03 where 25.5 m applies), the long-term care facility (R02 where 7.5 m applies), and the mobile home dwellings (R06 and R07 where 2.5 m applies).

7.3 NON-RESTRICTIONS

Sections 7.1 and 7.2 above identify the potential for an insignificant (1 dB) excess over the nighttime criteria at a few of the receptor location for the startup conditions at Millerton pit or Central pit, and only for the case with all excavation occurring in the single pit, during the nighttime, with 100% pit equipment compliment operating.

It is very possible that the predicted excess will not occur in practice, and is due only to the very conservative assumptions used in the supporting analysis. It is proposed that any equipment restrictions placed on the Millerton pit or Central pit startups are only under the following conditions:

- Until such time as a consideration of other factors, such as equipment use and positioning, reduction in equipment noise level emissions (quieter equipment including implementation of other noise mitigation techniques) and, in particular sound, level monitoring at the nearby receptor locations, demonstrate to the satisfaction of the District Manager that compliance with the applicable noise guidelines can be achieved.

8.0 SUMMARY AND CONCLUSIONS

1. An environmental control (sound barrier) berm, or ECB, will be provided at the perimeter of the ultimate pit outline. This assessment confirms that such a control berm is necessary to reduce off-site sound exposures at the nearby noise sensitive areas, which mostly consist of detached dwellings, as well as an apartment building, motel, and extended care facility. The ECB will be fully constructed in its entirety prior to the initiation of full mining operations.

2. Accounting for the fully constructed ECB, the modelling predictions indicate the daytime sound levels limits will be satisfied at all assessment receptor locations.

3. Accounting for the ECB fully constructed, the modelling predictions indicate the nighttime sound levels limits will be satisfied at all assessment receptor locations for all Operating Scenarios, and including the backfilling operations, with possible exception of two operating conditions, these being the startup conditions at Millerton pit or Central pit, and only for the case with all excavation occurring in the single pit. The modelling identifies the potential for an insignificant (1 dB) excess over the nighttime criteria at a few of the receptor locations.

4. To address the potential 1 dB nighttime excess for the Millerton or Central pit startup conditions, consideration has been given to slightly reducing the amount of equipment operating within the pit

during the nighttime, until such a time that adequate additional depth is achieved in the pit and thereby again permitting use of the full equipment compliment. It is proposed that the equipment restriction can be revoked based on the consideration of other factors, such as equipment use and positioning, reduction in equipment noise level emissions (quieter equipment), and sound level monitoring at the nearby receptor locations, such that it can be demonstrated to the satisfaction of the District Manager that compliance with applicable noise guidelines can be achieved without any equipment restrictions.

5. Noise control measures for the transportation corridor to the Dome Mill processing plant will consist of the standard 2.0-3.0 m high curbside berm (required in any case to address safety), and an increased 8.0 m high section at the north side in the vicinity of the residential areas to the north. This conclusion accounts for the storage of mine rock at the Dome site, and the associated increased number of trucks on the transportation corridor hauling waste rock.

GLOSSARY OF TERMS

Class 1 Area (MOE definition):

means an area with an acoustical environment typical of a major population centre, where the background sound level is dominated by the urban hum.

Class 2 Area (MOE definition):

means an area with an acoustical environment that has qualities representative of both Class 1 and Class 3 Areas, and in which a low ambient sound level, normally occurring only between 2300 and 0700 hours in Class 1 Areas, will typically be realized as early as 1900 hours.

Other characteristics which may indicate the presence of a Class 2 Area include:

- absence of urban hum between 1900 and 2300 hours;
- evening background sound level defined by natural environment and infrequency human activity; and
- no clearly audible sound from stationary sources other than from those under impact assessment.

Class 3 Area (MOE definition):

means a rural area with an acoustical environment that is dominated by natural sounds having little or no road traffic, such as the following:

- a small community with less than 1000 population;
- agricultural area;
- a rural recreational area such as a cottage or a resort area; or
- a wilderness area.

Construction (MOE definition):

"Construction" includes erection, alteration, repair, dismantling, demolition, structural maintenance, painting, moving, land clearing, earthmoving, grading, excavating, the laying of pipe and conduit whether above or below ground level, street and highway building, concreting, equipment installation and alteration and the structural installation of construction components and materials in any form or for any purpose, and includes any work in connection therewith.

Construction Equipment (MOE definition):

"Construction equipment" means any equipment or device designed and intended for use in construction, or material handling, including but not limited to, air compressors, pile drivers, pneumatic or hydraulic tools, bulldozers, tractors, excavators, trenchers, cranes, derricks, loaders, scrapers, pavers, generators, off-highway haulers or trucks, ditchers, compactors and rollers, pumps, concrete mixers, graders, or other material handling equipment.

Conveyance (MOE definition):

"Conveyance" includes a vehicle and any other device employed to transport a person or persons or goods from place to place but does not include any such device or vehicle if operated only within the premises of a person.

dB - Decibel:

See Sound (Pressure) Level.

dBA - A weighted decibel:

A nationally and internationally standardized frequency weighting applied to the sound level spectrum to approximate the sensitivity of the human hearing mechanism as a function of frequency (pitch).

L_{eq} - The energy equivalent continuous sound level:

The constant sound level over the time period in question, that results in the same total sound energy as the actually varying sound. Must be associated with a time period.

L_x - Statistical Sound Level Descriptor:

The sound level exceeded for x% of the time. For all practical purposes, L_{90} is the residual (lowest) ambient sound level.

Sound (Pressure) Level:

Measured in decibels (dB) it is the logarithmic ratio of the instantaneous energy of a sound to the energy at the threshold of hearing. Mathematically:

$$SPL \ (dB) = 20 \log \left(\frac{p}{p_0}\right)$$

where p is the pressure due to the sound and p_o is the pressure at the threshold of hearing, taken as 20 micro Pascals.

Stationary Source (MOE definition):

"Stationary source" means a source of sound which does not normally move from place to place and includes the premises of a person as one stationary source, unless the dominant source of sound on those premises is construction or a conveyance.

TABLE 3

NOISE SOURCE SUMMARY

Sound Source ID	Source Sound Power Level (dBA re 10^{-12} watts)	Source Locations[(1)]	Sound Characteristics[(1)]	Noise Control Measures[(2)]
Cubex Drill [(3)]	112.2	O	S	U
Smartrock Drill [(3)]	106.4	O	S	U
Hitachi 2500 Excavator [(3)]	114.9	O	S	U
CAT 992 Loader [(3)]	107.6	O	S	U
CAT 385 Excavator [(3)]	105.0	O	S	U
CAT D9/D10 Dozer [(3)]	117.5	O	S	U
CAT 16M Grader [(3)]	103.1	O	S	U
CAT 785 Haul Truck [(4)]	118.1	O	S	U
CAT 777 Water Truck [(4)]	122.0	O	S	U
Waste Truck Rock Dump [(5)]	135.0	O	S	U
Dome Crusher [(5)]	121.0	O	S	U

Notes:

(1) Source Location: O = outdoors; Sound Characteristics: S = steady
(2) Includes screening by perimeter environmental control berm (full build).
(3) Based on site measurements per SAE J88 (see Appendix H)
(4) Based on Caterpillar equipment manufacturers sound rating
(5) From previous Valcoustics site measurements at Dome Mine.

TABLE 4

APPENDIX A

ZONING PLAN

City of Timmins

ZONING BYLAW

Schedule 1

Legend

Neighbourhood Area Zones

- Low Density Residential
  - Residential First Density
  - Residential Second Density
  - Residential Third Density
- Medium Residential Density
  - Residential Medium Density 1
  - Residential Medium Density 2
- Institutional
- Commercial Neighborhood

Employment Area Zones

- Commercial
  - General Commercial
  - Highway Commercial
  - Resort Commercial
  - Neighbourhood Commercial
- Industrial
  - Light Industrial (Class 1)
  - Light Industrial (Class 2)
  - Light Industrial (Class 3)
  - Industrial Airpark
  - Mining
  - Salvage Yard
  - Waste Management Facility

Resource Development Zones

- Rural Residential
  - Residential Estate Type 1
  - Residential Estate Type 2
  - Waterfront Neighbourhood
  - Mobile Home Park
- Rural
  - Rural
  - Open Space
  - Hazard Lands
  - Mine Hazards - Tailings
  - Wetlands
  - Mineral Extraction

Intake Protection Zone 1

Intake Protection Zone 2

Other Features

- Transportation
  - Provincial Highway
  - City:
    - Arterial Road
    - Collector Road
    - Local Access Street
    - Resource Access Road
    - Private Road
  - Airport

1000m 2000m 3000m 4000m 5000m

Note: The base information on this plan was prepared from a variety of map sources and was used by permission of the City of Timmins. It is not a legal plan of survey. For precise location of plan features recourse should be had to the original source data.

APPENDIX B1

BASELINE SOUND LEVEL MONITORING SURVEY

TABLE B.1

SOUND MONITORING OF EXISTING (BASELINE) AMBIENT CONDITION – JULY 2007

Site ID[(1)]	Potential Source of Influence	Date	Start Time	Duration (hour : min)	Measured Sound Exposure (L_{eq}, dBA)[(2)]	Guideline Limit (dBA)	Comment
Monitoring Locations for Receptors with "A" Designations							
A-1 (long term)	Transportation Corridor	July 17 to 19, 2007	1212 hours	24 : 00	D-42 E-39 N-35	D-50 E-45 N-45	- unattended
A-2 / P-2 (short term)	Fence Line Waste Storage and/or Central Pit	July 18, 2007	1756 hours	00 : 20	D-49	50	- road traffic on Highway 101 - HVAC at Extendicare rooftop
		July 18, 2007	1735 hours	00 : 20	D-48	50	- road traffic on Highway 101 - HVAC at Extendicare rooftop
A-2* / P-2* (long term)	Fence Line Waste Storage and/or Central Pit	July 18 to 20, 2007	1835 hours	40 : 00	D-48 E-43 N-40	D-50 E-45 N-45	- unattended
A-3 (short term)	Transportation Corridor	July 17, 2007	1844 hours	00 : 20	D-44	50	- distant road traffic on Highway 101 to north
A-4 (long term)	Transportation Corridor	July 18 to 19, 2007	1708 hours	25 : 00	D-42 E-36 N-37	D-50 E-45 N-45	- unattended
A-5 (long term)	Transportation Corridor	July 20 o 21 2007	2239 hours	22 : 00	D-37 E-30 N-27	D-50 E-45 N-45	- unattended
Monitoring Locations for Receptors with "B" Designations							
B-1 (short term)	Beyond Primary Zone of Influence	July 19, 2007	2056 hours	00 : 20	E-46	46	- rustling leaves in trees
		July 20, 2007	1837 hours	00 : 20	D-39	50	- water flowing in nearby stream - road traffic to west and southwest
		July 21, 2007	1209 hours	00 : 20	D-58	50	- nearby power lawnmower

..../cont'd

TABLE B.1 (continued)

SOUND MONITORING OF EXISTING (BASELINE) AMBIENT CONDITION – JULY 2007

Site ID[(1)]	Potential Source of Influence	Date	Start Time	Duration (hour : min)	Measured Sound Exposure (L_{eq}, dBA)[(2)]	Guideline Limit (dBA)	Comment
Monitoring Locations for Receptors with "B" Designations (continued)							
B-2 (short term)	Beyond Primary Zone of Influence	July 20, 2007	1911 hours	00 : 20	E-42	45	- birds / distant road traffic - a few cars on McLean Drive
		July 21, 2007	1200 hours	00 : 20	D-48	50	- birds / distant road traffic - rustling leaves in trees
B-3 (short term)	Beyond Primary Zone of Influence	July 21, 2007	1320 hours	00 : 20	D-48	50	- road traffic on La Forest Rd - rustling leaves in trees
B-4 / C-2 (short term)	Beyond Primary Zone of Influence	July 18, 2007	1615 hours		D-46	50	- distant road traffic on Highway 101 to north
		July 19, 2007	1218 hours	00 : 24	D-49	50	- road traffic on Highway 655 - noise from quarry to northeast
		July 21, 2007	1351 hours	00 : 20	D-45	50	- road traffic on Highway 655 - noise from quarry to northeast
B-5 / C-6 (long term)	Beyond Primary Zone of Influence	July 19, 2007	2000 hours	24 : 00	D-44 E-44 N-36	D-50 E-45 N-45	- unattended
B-6 / C-7 short term)	Beyond Primary Zone of Influence	July 19, 2007	2026 hours	00 : 20	E-53	53	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 20, 2007	1451 hours	00 : 20	D-56	56	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 21, 2007	0011 hours	00 : 20	N-51	51	- Highway 655 road traffic dominant - noise from hospital HVAC equipment

..../cont'd

TABLE B.1 (continued)

SOUND MONITORING OF EXISTING (BASELINE) AMBIENT CONDITION – JULY 2007

Site ID[1]	Potential Source of Influence	Date	Start Time	Duration (hour : min)	Measured Sound Exposure (L_{eq}, dBA)[2]	Guideline Limit (dBA)	Comment
Monitoring Locations for Receptors with "C" Designations							
C-1 (short term)	Fence Line Waste Storage and/or Central Pit	July 20, 2007	1911 hours	00 : 20	E-42	45	- birds / distant road traffic - a few cars on McLean Drive
C-2 / B-4 (short term)	Beyond Primary Zone of Influence	July 18, 2007	1615 hours	00 : 20	D-46	50	- distant road traffic on Highway 101 to north
		July 19, 2007	1218 hours	00 : 24	D-49	50	- road traffic on Highway 655 - noise from quarry to northeast
		July 21, 2007	1351 hours	00 : 20	D-45	50	- road traffic on Highway 655 - noise from quarry to northeast
C-3 (short term)	Fence Line Waste Storage and/or all Pits	July 19, 2007	1100 hours	00 : 25	D-55	53[3]	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 20, 2007	1526 hours	00 : 20	D-53	53	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 21, 2007	0038 hours	00 : 20	N-47	47	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
C-4 (short term)	Fence Line Waste Storage and/or all Pits	July 19, 2007	1129 hours	00 : 20	D-59	53[3]	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 20, 2007	1526 hours	00 : 20	D-53	53	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
C-5 short term)	Fence Line Waste Storage and/or all Pits	July 19, 2007	1129 hours	00 : 20	D-63	58[3]	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 20, 2007	1552 hours	00 : 20	D-58	58	- Highway 655 road traffic dominant - noise from hospital HVAC equipment

..../cont'd

TABLE B.1 (continued)

SOUND MONITORING OF EXISTING (BASELINE) AMBIENT CONDITION – JULY 2007

Site ID [(1)]	Potential Source of Influence	Date	Start Time	Duration (hour : min)	Measured Sound Exposure (L_{eq}, dBA)[(2)]	Guideline Limit (dBA)	Comment
Monitoring Locations for Receptors with "C" Designations (continued)							
C-6 / B-5 (long term)	Beyond Primary Zone of Influence	July 19, 2007	2000 hours	24 : 00	D-44 E-44 N-36	D-50 E-45 N-45	- unattended
C-7 / B-6 (long term)	Beyond Primary Zone of Influence	July 19, 2007	2026 hours	00 : 20	E-53	53	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 20, 2007	1451 hours	00 : 20	D-56	56	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
		July 21, 2007	0011 hours	00 : 20	N-51	51	- Highway 655 road traffic dominant - noise from hospital HVAC equipment
C-8 (short term)	Fence Line Waste Storage and/or Central Pit	July 21, 2007	1539 hours	00 : 20	D-41	50	- rustling leaves in trees
Monitoring Locations for Receptors with "D" Designations							
D-1 (short term)	Dome Processing Plant	July 20, 2007	1318 hours	00 : 20	D-43	50	- distant traffic to northwest (Highway 101)
		July 20, 2007	2056 hours	00 : 20	D-42	50	- distant traffic to northwest (Highway 101)
D-1 (long term)	Dome Processing Plant	July 21 to 22, 2007	1810 hours	17 : 20	D-42 E-37 N-36	D-50 E-45 N-45	- unattended
D-2 (short term)	Dome Processing Plant	July 20, 2007	1405 hours	00 : 20	D-48	50	- distant traffic to northwest (Highway 101)
		July 20, 2007	2123 hours	00 : 20	E-46	46	- distant traffic to northwest (Highway 101)

..../cont'd

TABLE B.1 (continued)

SOUND MONITORING OF EXISTING (BASELINE) AMBIENT CONDITION – JULY 2007

Site ID [1]	Potential Source of Influence	Date	Start Time	Duration (hour : min)	Measured Sound Exposure (L_{eq}, dBA)[2]	Guideline Limit (dBA)	Comment
Monitoring Locations for Receptors with "P" Designations							
P-1 (short term)	92 Pit, Millerton Pit and/or Fence Line Waste Storage	July 17, 2007	1702 hours	00 : 20	D-47	50	- road traffic to south dominant
		July 18, 2007	1233 hours	00 : 20	D-55	50	- power lawn mower in distance - rustling leaves in trees
		July 19, 2007	1349 hours	00 : 20	D-49	50	- road traffic to north - rustling leaves in trees
		July 20, 2007	1651 hours	00 : 20	D-45	50	- road traffic to north - rustling leaves in trees
P-2 / A-2 (short term)	Fence Line Waste Storage and/or Central Pit	July 18, 2007	1756 hours	00 : 20	D-49	50	- road traffic on Highway 101 - HVAC at Extendicare rooftop
		July 18, 2007	1735 hours	00 : 20	D-48	50	- road traffic on Highway 101 - HVAC at Extendicare rooftop
P-2* / A-2* (long term)	Fence Line Waste Storage and/or Central Pit	July 18 to 20, 2007	1835 hours	40 : 00	D-48 E-43 N-40	D-50 E-45 N-45	- unattended
P-3 (short term)	92 Pit and/or Fence Line Waste Storage	July 18, 2007	1052 hours	00 : 20	D-58	55 [3]	- cars on Shania Twain Rd
		July 19, 2007	1803 hours	00 : 20	D-57	55 [3]	- idling transport truck nearby
		July 19, 2007	2139 hours	00 : 20	E-48	48	- road traffic on Highway 101 dominant
		July 21, 2007	1125 hours	00 : 20	D-55	55	- noise from commercial area to west

..../cont'd

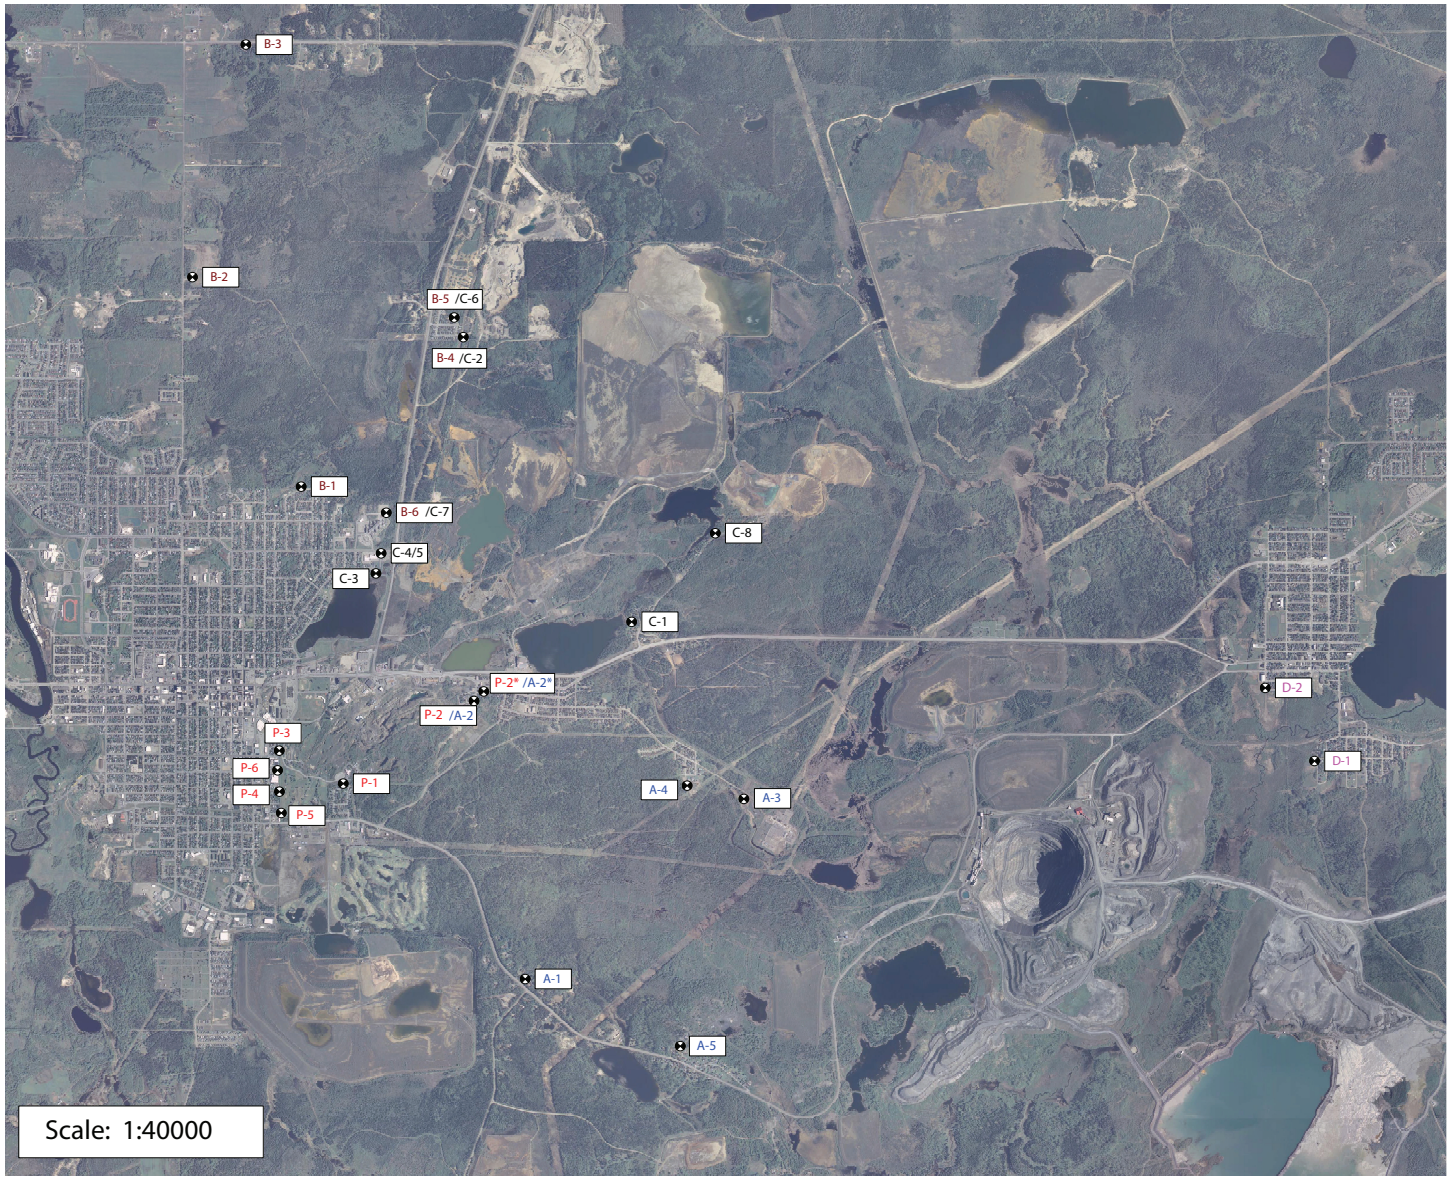

TABLE B.1 (continued)

SOUND MONITORING OF EXISTING (BASELINE) AMBIENT CONDITION – JULY 2007

Site ID [1]	Potential Source of Influence	Date	Start Time	Duration (hour : min)	Measured Sound Exposure (L_{eq}, dBA)[2]	Guideline Limit (dBA)	Comment
Monitoring Locations for Pit (continued)							
P-4 (short term)	92 Pit and/or Fence Line Waste Storage	July 18, 2007	1139 hours	00 : 26	D-48	50	- cars to/from Shania Twain Centre
		July 19, 2007	1810 hours	00 : 20	D-50	50	- distant traffic/urban hum
		July 20, 2007	1130 hours	00 : 20	D-44	50	- distant traffic/urban hum
P-5 (short term)	92 Pit and/or Fence Line Waste Storage	July 18, 2007	1145 hours	00 : 20	D-46	50	- cars to/from Shania Twain Centre
P-6 (long term)	92 Pit and/or Fence Line Waste Storage	July 20-21, 2007	1201 hours	28 : 00	D-43 E-42 N-38	D-50 E-45 N-45	- unattended

Notes:

(1) See Figure 2.1.
(2) D= 0700 to 1900 hours daytime period; E = 1900 to 2300 hours evening period; N = 2300 to 0700 hours nighttime period.
(3) Applicable limit is determined by the lowest indicated value occurring during the same daytime, evening or nighttime period.
