

Contrary to popular belief – West Kelowna does **NOT** get its water from Lake Okanagan.

POWERS CREEK WATER TREATMENT PLANT

The facility receives water from Powers Creek in Glen Canyon. The 139 square kilometer (km) watershed, located primarily within Crown provincial land, contains six reservoir lakes that feed into Powers Creek in Glen Canyon. Tadpole, Dobbin, Horseshoe, Paynter, Jackpine, and Lambly (Bear) reservoirs provide more than 10,500 mega litres (ml) of stored water reserves.

Today, the system serves more than 4,700 customers including approximately 4,400 residential, 150 business, 150 agricultural and 30 industrial (parks, schools) connections.

ROSE VALLEY WATER TREATMENT PLANT

The Rose Valley Watershed encompasses 244 square km, and contains 2 storage reservoirs (Esperon and Big Horn) that feed into Bear Creek and ultimately Rose Valley Reservoir. Together, these three reservoirs provide over 6,000ml of raw water storage for the Rose Valley Water Treatment Plant.

Today, the system serves more than 8,215 customers including approximately 8,000 residential, 150 business, 150 agricultural and 50 industrial (parks, schools) connections.
